## 1 Introduction

This document contains a description of NMEA output sentences and NMEA commands which are implemented in the standard GPS firmware used in the GPS modules A1080. Only fully available commands are described. For more details of the original SiRF firmware please see **chapter 5.2 Related Documents**.

The purpose of this paper is the explanation of the behavior of the “NMEA” interface, i.e. a description of the outputs coming from this interface, and a summary of the commands that can be issued to this interface. This will allow easy and full adjustment and control of the module.

### 1.1 Serial Port Configuration

The firmware supports the bi-directional serial interface of Tyco Electronics’ GPS module. It is implemented by use of the full duplex UART (Universal Asynchronous Receiver Transmitter) interface of the GPS processor.

- For the communication with UART the use of a kind of terminal program or another appropriate method is necessary.
- NMEA communication is always on port 0 (pin Tx0 and Rx0) of the module or on the serial USB port of the EVA1080-A Demo Kit, respectively.
- The default configuration of this serial port is: 4800 baud, 8 data bits, no parity, 1 stop bit, no flow control.

This interface is bi-directional, i.e. on the one side the output of the GPS modules (NMEA sentences, etc.) is sent to the UART interface, on the other side the UART interface can be used to send commands to Tyco Electronics’ GPS modules.

## 2 Standard NMEA Sentences

### 2.1 Introduction

The National Marine Electronics Association created a uniform interface standard for digital data exchange between different marine electronic products back in the early nineteen-eighties.

- NMEA information is transmitted from a ‘vendor’ in ‘sentences’ with a maximum length of 80 characters.
- The general format is:  
“\$<vendor><message><parameters>\*<checksum><CR><LF>”.
- The combination of <vendor><message> is called address field.
- The vendor code for the Global Positioning System is “GP”.
- In this document NMEA sentences refer to the NMEA 0183 Standard.

For details see:

<http://www.nmea.org/>

<http://www.nmea.org/pub/index.html>

For an introduction into GPS NMEA sentences see:

<http://home.mira.net/~gps/nmea.html>

### 2.2 Supported NMEA Sentences

The Tyco Electronics’ GPS firmware currently supports 6 NMEA sentences:

- \$GPGGA (default: ON)
- \$GPVTG (default: OFF)
- \$GPRMC (default: ON)
- \$GPGSA (default: ON)
- \$GPGSV (default: ON, 0.2Hz)
- \$GPGLL (default: OFF)

**Note:** please consider max transfer rate (depending on baud rate setting) before activating additional NMEA sentences

The following paragraphs give an overview of NMEA messages with example strings and short explanation.

### 2.2.1 GGA - Global Positioning System Fix Data

|                                                                               |            |                                                                                                                   |
|-------------------------------------------------------------------------------|------------|-------------------------------------------------------------------------------------------------------------------|
| e.g. \$GPGGA,152145.000,4805.8193,N,01132.2317,E,1,04,2.5,607.5,M,47.6,M,,*67 |            |                                                                                                                   |
| (1)                                                                           | \$GPGGA    | Vendor and message identifier                                                                                     |
| (2)                                                                           | 152145.000 | Universal time coordinated (15h 21m 45.000s)                                                                      |
| (3)                                                                           | 4805.8193  | Latitude (48deg 05.8193min)                                                                                       |
| (4)                                                                           | N          | N North<br>S South                                                                                                |
| (5)                                                                           | 01132.2317 | Longitude (011deg 32.2317min)                                                                                     |
| (6)                                                                           | E          | E East<br>W West                                                                                                  |
| (7)                                                                           | 1          | Fix quality: 0 fix not valid or invalid,<br>1 GPS SPS mode, fix valid,<br>2 Differential GPS, SPS mode, fix valid |
| (8)                                                                           | 04         | Four satellites in use (min 00, max 12)                                                                           |
| (9)                                                                           | 2.5        | Horizontal dilution of precision                                                                                  |
| (10)                                                                          | 607.5      | MSL altitude                                                                                                      |
| (11)                                                                          | M          | Unit of antenna altitude: meters                                                                                  |

Table 2-6: GLL example and description

## 3 Proprietary NMEA Sentences

NMEA input messages enable you to control the receiver while in NMEA protocol mode. By default, the receiver is configured for NMEA mode on port 0. Messages can be send by using a terminal program, by using Tyco Electronics' GPS Cockpit software, or the SiRF demo software. If the receiver is in SiRF binary mode, all NMEA input messages are ignored. Once the receiver is put into NMEA mode, the following messages may be used to command the module.

### 3.1 Transport Message

Device manufacturer define extensions of the standard NMEA protocol or sentences thereof.

- The general format is:  
"\$<vendor><MID><parameters><\*checksum><CR><LF>".

Vendor: A1080 is using "PSRF"  
MID: Message identifier consisting of three numeric characters.  
Input Messages begin at MID 100.  
Parameters: Message specific parameters refer to a specific section for <data> ... <data> definition.  
Cksum: Two hex character checksum as defined in the NMEA specification. Use of checksum is required on all input messages!

**Note1:** All fields in all proprietary NMEA messages are required, none are optional.  
All NMEA messages are comma delimited.

**Note2:** Both, GPS Cockpit and SiRF demo software support the calculation of a checksum.

### 3.2 NMEA Input Messages

The following NMEA input messages are supported.

| Message                 | MID <sup>(1)</sup> | Description                                                |
|-------------------------|--------------------|------------------------------------------------------------|
| Set serial port         | 100                | Set Port 0 parameters and protocol                         |
| Reset Configuration     | 101                | Initialize various start up behaviors                      |
| Query/rate control      | 103                | Query standard NMEA message and/or set output rate         |
| Development data On/Off | 105                | Development Data messages On/Off                           |
| Select Datum            | 106                | Selection of datum to be used for coordinate transformting |

- (1) Message Identification (MID)

Table 3-1: NMEA Input Messages

**Note:** NMEA input messages 100 to 106 are SiRF proprietary NMEA messages.

### 3.3 Serial Port Set-up

This command message is used to set the protocol (SiRF binary or NMEA) and/or the communication parameters (baud rate, data bits, stop bits, and parity).

Generally, this command is used to switch the module back to SiRF binary protocol mode where a more extensive command message set is available. When a valid message is received, the parameters are stored in battery-backed SRAM and the A1080 restarts using the saved parameters.

- \$PSRF100,0,9600,8,1,0\*0C

| Name       | Example   | Description                             |
|------------|-----------|-----------------------------------------|
| Message ID | \$PSRF100 | PSRF100 protocol header                 |
| Protocol   | 0         | 0 SiRF binary / 1 NMEA                  |
| Baud       | 9600      | 4800, 9600, 19200, 38400, 57600, 115200 |
| DataBits   | 8         | 8, 7 <sup>(1)</sup>                     |
| StopBits   | 1         | 0, 1                                    |
| Parity     | 0         | 0 none / 1 odd / 2 even                 |
| Checksum   | *0C       | End of message termination              |

- (1) Sirf protocol is only valid for 8 data bits, 1 stop bit and no parity

Table 3-2: Serial Port Set-up

### 3.4 Reset Configuration (*SiRF's original: NavigationInitialization*)

This command is used to configure various reset situations (Hot Start, Warm Start and Cold Start).

- \$PSRF101,0,0,0,0,0,0,12,4\*10

| Name         | Example   | Units   | Description                                       |
|--------------|-----------|---------|---------------------------------------------------|
| Message ID   | \$PSRF101 |         | PSRF101 protocol header                           |
| ECEF X       |           | meters  | X coordinate position                             |
| ECEF Y       |           | meters  | Y coordinate position                             |
| ECEF Z       |           | meters  | Z coordinate position                             |
| ClkOffset    |           | Hz      | Clock Offset of the A1080-A <sup>(1)</sup>        |
| TimeOfWeek   |           | seconds | GPS Time Of Week                                  |
| WeekNo       |           |         | GPS Week Number                                   |
| ChannelCount | 12        |         | Range 1 to 12                                     |
| ResetCfg     | 4         |         | Reset configurations: See Table 3-4 and Table 3-5 |
| Checksum     | *10       |         | End of message termination                        |

- (1) Use 0 for last saved value if available. If this is unavailable, a default value of 96,000 is used

Table 3-3: Navigation Initialization

| Hex  | Description                                                                             |
|------|-----------------------------------------------------------------------------------------|
| 0x01 | Hot Start— All data valid                                                               |
| 0x02 | Warm Start—Ephemeris cleared                                                            |
| 0x04 | Cold Start—Clears all data in memory                                                    |
| 0x08 | Clear Memory—Clears all data in memory and resets the receiver back to factory defaults |

Table 3-4 Reset configurations

### 3.5 Query/Rate control

This command is used to control the output of standard NMEA messages GGA, GLL, GSA, GSV, RMC, and VTG. Using this command message, standard NMEA messages may be polled once, or setup for periodic output. Checksums may also be enabled or disabled depending on the needs of the receiving program. NMEA message settings are saved in battery-backed memory for each entry when the message is accepted.

Table 3-6 contains the input values for the following examples:

1. Query the GGA message with checksum enabled
  - \$PSRF103,00,01,00,01\*25
2. Enable VTG message for a 1 Hz constant output with checksum enabled
  - \$PSRF103,05,00,01,01\*20
3. Disable VTG message
  - \$PSRF103,05,00,00,01\*21

| Name        | Example   | Units   | Description                             |
|-------------|-----------|---------|-----------------------------------------|
| Message ID  | \$PSRF103 |         | PSRF103 protocol header                 |
| Msg         | 00        |         | See Table 3-7                           |
| Mode        | 01        |         | 0=SetRate, 1=Query                      |
| Rate        | 00        | seconds | Output rate<br>0 off<br>Max 255         |
| CksumEnable | 01        |         | 0 Disable Checksum<br>1 Enable Checksum |
| Checksum    | *25       |         | End of message termination              |

Table 3-6 Query/Rate Control Data Format (See example 1)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | GGA                                   |
| 1     | GLL                                   |
| 2     | GSA                                   |
| 3     | GSV                                   |
| 4     | RMC                                   |
| 5     | VTG                                   |
| 6     | MSS (If internal beacon is supported) |
| 7     | Not defined                           |
| 8     | ZDA (if 1PPS output is supported)     |
| 9     | Not defined                           |

Table 3-7 NMEA Messages

**Note:** please consider max transfer rate (depending on baud rate setting) before activating additional NMEA sentences

**Note:** In TricklePower mode, update rate is specified by the user. When switching to NMEA protocol, the message update rate is also required. The resulting update rate is the product of the TricklePower update rate and the NMEA update rate (i.e., TricklePower update rate = 2 seconds, NMEA update rate = 5 seconds, resulting update rate is every 10 seconds,  $(2 \times 5 = 10)$ ).

### 3.6 Development Data On/Off

Use this command to enable development data information if you are having trouble getting commands accepted. Invalid commands generate debug information that enables you to determine the source of the command rejection. Common reasons for input command rejection are invalid checksum or parameter out of specified range.

Table 3-10 contains the input values for the following examples:

1. Debug On

- \$PSRF105,1\*3E

2. Debug Off

- \$PSRF105,0\*3F

| Name       | Example   | Description                |
|------------|-----------|----------------------------|
| Message ID | \$PSRF105 | PSRF105 protocol header    |
| Debug      | 1         | 0 Off<br>1 On              |
| Checksum   | *3E       | End of message termination |

Table 3-10 Development Data On/Off Data Format

### 3.7 Select Datum

The A1080 GPS receiver performs initial position and velocity calculations using an earth-centered earth-fixed (ECEF) coordinate system. Results may be converted to an earth model (geoid) defined by the selected datum. The default datum is WGS84 (World Geodetic System 1984) which provides a worldwide common grid system that may be translated into local coordinate systems or map datums. Local map datums are a best fit to the local shape of the earth and not valid worldwide.

Table 3-11 contains the input values for the following examples:

#### 1. Datum select TOKYO\_MEAN

- \$PSRF106,178\*32

| Name       | Example   | Description                                                                           |
|------------|-----------|---------------------------------------------------------------------------------------|
| Message ID | \$PSRF106 | PSRF106 protocol header                                                               |
| Datum      | 178       | 21=WGS84<br>178=TOKYO_MEAN<br>179=TOKYO_JAPAN<br>180=TOKYO_KOREA<br>181=TOKYO_OKINAWA |
| Checksum   | *32       | End of message termination                                                            |

## 4 Related Information

### 4.1 Contact

This manual was created with due diligence. We hope that it will be helpful to the user to get the most out of the GPS module.

Anyway, inputs about errors or mistakable verbalizations and comments or proposals to TYCO Electronics, Power Systems in Munich, Germany, for further improvements are highly appreciated.
